

.STUDY OF “ DOG BITE “ IN THE HEAD AND NECK REGION .

THE NEW EGYPTIAN JOURNAL OF MEDICINE , 5 :774, 1991

دراسة عضة الكلب فى منطقة الوجه والفكين .

ABSTRACT :

Though relatively infrequent , animal bites in the head and neck region can produce potentially serious pathologic conditions that must be judiciously addressed .Facial wound caused by animal attack require proper wound management .Moreover , the evaluation and treatment plan of facial wounds must always include the possibility of rabies .BECAUSE OF ITS INFREQUENT OCCURRENCE IN HUMANS , MANY CLINICIANS may not be cognizant of the current antirabies prophylaxis .So , this study was undertaken to elucidate a recommended protocol for rabies control and the treatment of associated bites and scratch wounds .
